Abstract

*Embelia ribes* is a kind of Embelia. Burm. f. is a member of the Myrsinaceae family, which grows in hilly areas of India up to 1500 metres in elevation, from the outer Himalayas to the Western Ghats. *Embelia ribes* Burm. f. is a rare medicinal plant that has been studied extensively for its diverse medicinal characteristics. The use of medicinal plants in therapeutics is perhaps as old as recorded history. *Embelia ribes* is one of most significant medicinal plant. Nearly each part of this plant contains varied chemical constituents and is utilized within the treatment of various. Broad inquire about work has been detailed in last few decades on this important plant of *Embelia ribes* berries contain a few chemical constituents like embelin, volatile oil, fixed oil, resin, tannin, christembine, phenolic acids like caffeic acid, vanillic acid, chorogenic acid, cinnamic acid, o-umaric acid 4.33% of the embelin content is observed within the berries of *Embelia ribes* Burm F. It is a critically endangered medicinal plant known for its digestive, carminative, and laxative effects. *Embelia ribes* also has the following properties: Anthelmintic, antibacterial, antioxidant, anti-diabetic, anticonvulsant, anti-cancer, and antihyperlipidemic, Anti fungal, Antihyperoxycysteinemic, Molluscidial, Wound healing, Antifertility, Antihyperglycemic, Antitumor and anti-inflammatory, Chemotherapeutic, Contraceptive, Anxiolytic, Antidepressant, Antimitotic, Cardio protective effect, Antiosbesity, and Antihyperlipidemic are all treated with it. *Embelia ribes* was studied for its hepatoprotective and analgesic properties.

Keywords: *Embelia ribes*, pharmacognosy, phytochemistry, pharmacological activity

Introduction

The *Embelia ribes* Burm. f., also known as Vidanga or Baibidanga in Ayurvedic medicine, has been an essential ingredient in a variety of ayurvedic compositions [1]. The three ancient Indian ayurvedic books, Charakh Samhita, Sushruta Samhita, and Ashtanga hridayam, all reference Vidanga. Vidanga is also stated to be employed in Unani (Baobarang), Siddha (Vaivilangam), Folk, Tibetan (Byi dan ga), and Homeopathic (*Embelia ribes*) medicinal systems, in addition to Ayurveda. Vidanga has been linked to the herb *Embelia ribes* Burm. f. by many Ayurvedic and botanists. Vidanga was first listed as an official medicament in the Indian Pharmacopoeia in 1966, with the botanical origin being limited to the fruits of *E. ribes*. Since then, the dried berries of *E. ribes* fruits belonging to the Myrsinacea family have been largely regarded as the botanical source of the narcotic Vidanga. Although *E. ribes* has been used in various therapeutic systems such as Unani, Homeopathy, and others, it has not been proven to be effective [2].

In Sanskrit, this plant is known as Krimighna, Vidanga in Assamese, Marathi, Oriya, Bengali, Vavding in Gujarati, Vayavidanga in Hindi, Kannada, Babading in Kashmiri, Vizhalari in Malayalam, Babrung in Punjabi, Vayuvidangam in Tamil, Vayuviodangalu in Telugu, and Baobarang in Urdu [3]. *Embelia ribes* Burm. f. Is also known as White flowered Embelia and False Black Pepper. At an altitude of 1,500 metres, *E. ribes* grows in semi-evergreen and deciduous forests in the middle and lower Himalayas, Arunachal Pradesh, Assam, Bengal, Orissa, Andhra Pradesh, and Madhya Pradesh [4].

Vidanga is a scrambling shrub that resembles a climber. The roots are brownish grey in colour, with reddish roots that are hairy. With a mature girth of 45-72 cm, the stem is pale grey and studded with lenticels. Coriaceous leaves are elliptic, lanceolate, 6-14 cm long and 2-4 cm wide, alternating, acuminate entire, absolutely hairless, and petiole 1-0.8 cm
margined. Flowers are pentamemorous, small, white or yellow, and pentamemorous. Fruits are small, 2.4-4 mm in diameter, ovoid to subglobose in shape, tapping with style, smooth, juicy, wrinkled, and lacking a calyx. The seeds start off reddish, but as time goes on, they turn slightly black. Seeds are contained in clockwise pericarp, which is covered by a thin membrane that, when removed, reveals a bright spot on the seeds that disappears following immersion in water. The seeds are hairy, have ruminated endosperm, and are depressed at the base. Aromatic and astringent, with a hint of pungency in the finish. The fruits, leaves, and roots of this plant are used to treat a variety of ailments [5]. The entire plant is used to cure rheumatism and fever, as well as abdominal and lung illnesses, constipation, indigestion, fungal infections, mouth ulcers, sore throats, pneumonia, heart disease, and obesity [6]. The fruit has a harsh taste, makes a nice appetiser, and is used to treat tumours, ascites, bronchitis, jaundice, and mental illnesses [7]. The fruit of Embelia ribes has been noted as having the best krimiguna (wormicidal) properties against infections in Ayurvedic texts [8]. Seeds have antibacterial, anthelmintic, antituberculosis, alternative, and stimulative properties [2]. The leaves are astringent, demulcent, and depurative, and can be used to treat pruritus, sore throats, mouth ulcers, indolence, skin disorders, and leprosy [9]. Embelia ribes fruits contain the quinone derivative embelin (3-undecyl 2, 5-dihydroxy, 1,4-benzoquinone), the alkaloid christembine [10] and the volatile oil vilangin; its chemical components are 2,5-dihydroxy-4-undecyl-3,6-benzoquinone, 2,5-dihydroxy-4-undecyl-3,6-benzoquinone, and the alkaloid [11]. Embelic acid, tannins, christembine, and embelin [1] are all prominent ingredients of the fruit. There's also vilangin, 2, 5-isobutylamine salts, quercetin, and volatile oil [11-14]. Embelin was antibacterial as well as anticonvulsant. Embelia ribes extracts demonstrated strong anthelmintic [17-20] antioxidant [21-23], neuroprotective [23], antifertility, and antiestrogenic activities [24].

**Embelia ribes**

*Embelia ribes* Burm F. is a large scandent shrub, disturbed throughout India and has a place to the family Myrsinaceae. It is commonly known as false black pepper or Vidanga. *E. ribes* grows in semi-evergreen and deciduous timberlands at an height of 1,500m found in central and lower Himalayas, Arunachal Pradesh, Assam, Bengal, Orissa, Andhra Pradesh and Madhya Pradesh all through India [26].

**Phytochemistry**

The ripe fruits of *E. ribes* are the most commercially valuable component of the plant because they contain Embelin, the active chemical [23].

![Chemical Structure of Embelin](image)

*Embelia ribes* berries contain several chemical constituents such as embelin, volatile oil, fixed oil, resin, tannin, christembine, phenolic acids such as caffeic acid, vanillic acid, chrorogenic acid, cinnamic acid, and o-cumarc acid, and phenolic acids such as caffeic acid, vanillic acid, chrorogenic acid, cinnamic acid, and o-cuma The berries of *Embelia ribes* Burm F have 4.33 percent of the embelin content. Potassium embelate, methylenebis (2, 5-dihydroxy-4-undecyl-3-6-benzoquinone), embelin, quercitol, fatty components, and vilangin are all found in the plant. Along with embelin, three novel compounds were recovered from the seeds of *Embelia ribes*: embelinol, embelianaryl ester, and embeliol [28]. The seeds of *E. ribes* were also found to include Cr, K, Ca, Cu, Zn, and Mn, as well as a high carbohydrate content [25-29].

N-(3-carboxylpropyl)-5-amino-2-hydroxy-3-tridecyl-1, 4-benzoquinone, an uncommon nitrogen-containing 3-alkyl-1, 4-benzoquinone derivative, and a gomphilaconte derivative, 5,6-dihydroxy-7-tridecyl-3-[4-tridecyl-3-hydroxy-5-oxo 2(5H)-furylidene] -2-oxo-3(2H) Ethanolic extract was used to isolate -benzofuran from the roots of *E. ribes* [28]. The aqueous and alcoholic extracts were subjected to a qualitative analytical test to evaluate the presence of several phytoconstituents such as alkaloids, carbohydrate, saponins, and phenolic compounds, proteins, oil and fats, and mucilage for preliminary phytochemical screening. The fruit powder of *Embelia ribes* was subjected to a qualitative photochemical screening [29].

<thead>
<tr>
<th>Analgesic activity</th>
<th>Embelin</th>
<th>[95, 96].</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analinethmic activity</td>
<td>When <em>Embelia ribes</em> seed oil was given in different doses, such as 10 mg/ml, 50 mg/ml, and 100 mg/ml, the worms died (Pheretima posthuma). But reaction of worms to different doses differed in the time of paralysis parameter. The time of paralysis was reported to be shorter as the dose was increased. When compared to conventional piperazine citrate (10 mg/ml), the results are considerable. In goats with mixed gastrointestinal nematode infections, <em>Embelia ribes</em> fruit extract combined with Veronica anthelmintica seed extract administered at 1g/kg resulted in a significant reduction in the number of faecal eggs per gramme (EPG) [95, 96].</td>
<td></td>
</tr>
<tr>
<td>Antianxiety activity</td>
<td>Behavioral parameters were used to assess anxiolytic action in the elevated plus maze test, open field test, and light and dark test. The number of entries and percentage of time spent in open arm increased in the elevated plus maze. Embelin has a notable anxiolytic effect [97], which lowers the natural aversion to light and increases the duration spent in the illuminated compartment in a dose-dependent manner. The agonistic impact on the GABA/benzodiazepine receptor combination could explain the observed activity [98].</td>
<td></td>
</tr>
<tr>
<td>Anti-bacterial activity</td>
<td>When compared to the conventional medicine nitrofurazone, which has a 22 mm diameter of zone of inhibition against the test organism Bacillus subtilis, <em>Embelia ribes</em> at a dose of 500 mg/50ml reported a 12 mm diameter of zone of inhibition. <em>Embelia ribes</em> had no antimicrobial or inhibitory activity against Pseudomonas aeruginosa, Staphylococcus aureus, or Escherichia coli [99-100].</td>
<td></td>
</tr>
<tr>
<td>Antinematodal activity</td>
<td>In goats, the antinematodal action of a combination of Veronica anthelmintica seed (Kali zeeri) and <em>Embelia ribes</em> fruit (Babrang) was tested. EPG (Egg per gramme) counts were performed in the faeces before and on the 3rd, 10th, and 15th days of treatment with the powder in 0.5, 1, and 2 g/kg body weight doses, as well as water and methanol extracts equivalent to 2 g/kg of the original powder. On the 15th day after treatment, data analysis revealed that 2 extract and 0.01 g/kg morantel tartrate are equally efficacious and safe in treating natural gastrointestinal nematodes in local goats [101].</td>
<td></td>
</tr>
<tr>
<td>Ascaridical properties</td>
<td><em>Embelia vibrations</em> (fruit) is used to treat goats with gastrointestinal nematode infections by administering seed oil extract to Taenia and Hookworm [46].</td>
<td></td>
</tr>
<tr>
<td>Anti-cancer activity</td>
<td>In rats with experimental fibrosarcoma, embelin has been shown to reduce tumour size and block the increase in activity of serum enzymes such as acid phosphatase, -glutamyl transferase, lactate dehydrogenase, aldose, and others. In tumor-bearing mice, Embelin disrupts glucose and amino acid metabolism. In adult male Wistar rats, embelin 50 mg/kg/day in conjunction with curcumin 100 mg/kg/day reduced N-nitrosodiethylamine-induced hepatic hyperplastic nodules, body weight loss, increases in hepatic diagnostic markers, and hypoproteinemia. The osteoclasts are the ones who cause the osteolysis seen in tumour bone metastases. RANKL (receptor activator for nuclear factor kB ligand), a member of the TNF superfamily and a signalling pathway activator, has emerged as a prominent mediator of bone loss, which is usually associated with cancer and other chronic inflammatory illnesses [102-103].</td>
<td></td>
</tr>
<tr>
<td>Anticonvulsant activity</td>
<td>Embelin i.p. (intraperitoneal) treatment at doses of 2.5, 5, and 10 mg/kg body weight effectively reduced seizures caused by electroshock and pentylenetetrazole, with action comparable to phenytoin and diazepam. Significant reduction in motility demonstrated C.N. S depressive action. The finding implies that embelin has anticonvulsant properties in both grand mal and petit mal epilepsy [105].</td>
<td></td>
</tr>
<tr>
<td>Antidepressant activity</td>
<td>Antidepressant action was achieved by injecting embelin into mice via the intraperitoneal route 30 minutes before the onset of experimental depression. Embelin has been discovered to have therapeutic potential in the treatment of mental depression [104].</td>
<td></td>
</tr>
</tbody>
</table>
| Antifertility activity | *Embelia ribes* Burm was used to extract the embelin. At doses of 0.3, 0.4, and 0.5 mg/kg body weight applied subcutaneously for 35 days, berries changed testicular histology and glycogen, gametogenic counts, and accessory
sex gland fructose. The chemical is thought to have anti-androgenic properties. An oral herbal contraceptive would allow couples to control their fertility without having to contact a doctor, resulting in a significant increase in the number of couples using family planning. Dacus carota, Butea monosperma, and anti-implantation action); and Mentha arvensis (pregnancy prevention) (leaves have anti-implantation effect). There are numerous references in India to plants that have antifertility characteristics [109].

Antifungal activity
The test technique NCCLS was used to evaluate the antifungal activity of Embelia ribes utilising standard in vitro antifungal susceptibility (The national committee for clinical laboratory standard M27-A2 Protocol). The NCCLS approach demonstrated that the methanol extract of Embelia ribes and embelin had the lowest MIC50 range of 120 mg/L against Candida albicans (MTCC no. 183) and that embelin had the highest MIC50 range of 120 mg/L among the four Candida species tested MIC50[109].

Antimitotic activity
Embelin and Embelin derivatives have antimitotic properties [107].

Antioxidant property
The levels of pancreatic superoxide dismutase, catalase, and glutathione in streptozotocin (at a dose of 40 mg/kg, intravenously as a single dose) induced diabetic rats were significantly reduced by an aqueous extract of Embelia ribes administered orally at doses of 100 mg/kg and 200 mg/kg body weight. In streptozotocin-induced diabetic rats, its antioxidant activity protects the pancreatic -cells from loss [108].

Cardio protective effect
Emblica ribes aqueous extract significantly reduced systemic blood pressure and heart rate. Elevated blood creatinine kinase, serum lactate dehydrogenase, and dramatically increased myocardial endogenous antioxidants levels are other possible outcomes [109].

Wound healing property
Both Embelia ribes ethanolic extract (30 mg/ml) and embelin showed considerable wound healing efficacy. The epitheliazation of the incision wound was faster in embelin-treated groups (4 mg/ml of 0.2 percent sodium alginate gel) with a high rate of wound contraction. The incision wound's tensile strength was substantially higher than that of the ethanol extract. In addition, the weight of the granulation rose in the deed space model, indicating a rise in collagenation. Histological analysis of the embelin-treated group's granulation tissue revealed enhanced cross-linking of collagen fibres and the absence of monocytes. The results are compared to those of framycetin, a common skin treatment [110].

Anti-diabetic activity
In streptozotocin (administered at a dose of 40 mg/kg, intravenously single dose) induced diabetic rats, aqueous extract of Embelia ribes fruits at doses of 100 and 200 mg/kg orally fed for forty days caused a significant (p<0.01) decrease in heart rate, systolic blood pressure, blood glucose, blood glycosylated haemoglobin, serum lactate dehydrogenase. In this investigation, gliclazide is employed as a control. Further research found that an ethanolic extract of Embelia ribes fruits reduced pancreatic thiobarbituric acidreactive substances (TBARS) in diabetic rats' pancreatic tissue considerably (p<0.01) [111].

Antihyperglycemic activity
Oral herbal medicines based on folk medicine have been used to treat diabetes mellitus. The anthelmintic action of Embelia ribes burn (Myrisinae), also known as vidanga, was used in Ayurveda. Vidanga is pungent, according to Ayurveda. Increases digestive fire, which relieves gas and colic. In a single study, the antihyperglycemic activity of E. ribes decoction in glucose-induced diabetes in rats was studied, as well as the lipid-lowering and antioxidant capacity of ethanolic extract of E. ribes Burn in streptozotocin (40 mg/kg, IV, single injection)-induced diabetes [112].

Antihyperlipidemic activity
When compared to pathogenic diabetic rats induced by streptozotocin (at a dose of 40 mg/kg intravenously), ethanolic extract of Embelia ribes administered orally at a dose of 200 mg/kg for 20 days showed a significant (p<0.01) decrease in blood glucose, serum total cholesterol and triglycerides, and an increase in HDL-cholesterol levels. The extract also reduced thiobarbituric acid reactive substances in the liver and pancreas. (TBARS) values (p<0.01) when compared to TBARS values of liver and pancreas of the pathogenic diabetic rats [113].

Antihyperhomocysteinemic activity
The anti-hyperhomocysteinemic activity of Embelia ribes was tested in adult male Wistar rats with hyperhomocysteinemia. Methionine therapy (1 g/kg p.o.) for 30 days was used to generate hyperhomocysteinemia. The administration of Embelia ribes aqueous extract (100 and 200 mg/kg p.o.) to hyperhomocysteinemic rats for 30 days decreased homocysteine, LDH, total cholesterol, triglycerides, LDL-C, and VDL-C and elevated HDL-C levels in serum substantially (p<0.01). The results are comparable to the standard antihyperhomocysteinemic drug folic acid [114].

Molluscidal activity
Embelia ribes fruit powder was employed against Lymnea acuminata in binary and tertiary combinations with Azadirachta indica and Cedrus deodara oil, as well as synergists MGK-264 and piperonyl butoxide (PB) in binary and tertiary combinations. The hazardous effects of these mixes were found to be time and dose dependent. In comparison to the single treatment of plant-derived molluscicides with synergists, the binary and tertiary combinations of plant-derived molluscicides with synergists were more harmful [115].

Antiproliferative activity
The biological activity of 5-O-ehylembelin (1) and 5-O-methyl embelin (2), both 1, 4-benzoquinone derivatives, were studied. When compared to normal marsupial kidney ceeks, both displayed antiproliferative efficacy against a panel of human carcinoma cell lines (Ptk2). In a dose- and time-dependent manner, they arrested HL-60 cells in the G (0)/G (1) phase of the cell cycle. Exposure to 100 microM
of 1 or 2 for 6 hours caused total breakdown of the microtubule network in HeLa cells, as well as an increase in the number of cells halted in mitotic phases. In HL-60 cells, treatment with 10 microM of 1 and 2 for 24 hours caused apoptosis. This evidence suggests that both 1 and 2 are promising novel anti-mitotic and anti-cancer molecules targeting microtubular proteins [116].

**Antispermatic activity**
The active principle of *Embelia ribes* Burm seeds, Embelia, has been isolated and its purity verified. The substance inhibited: a) epididymal motile sperm count, b) fertility indices such as pregnancy attainment and litter size, and c) the activities of glycolysis and energy metabolism enzymes after daily subcutaneous treatment of 20 mg/kg body weight to male albino rats for 15 or 30 days. After 15 and 30 days of recuperation, these modifications were reversible. When embelin was added to epididymal sperm suspensions, it inhibited spermatozoal motility and glucose metabolism enzyme activity in a dose and duration-dependent manner. [117].

**Antitumor and anti-inflammatory activities**
Embelin, a plant-based benzoquinone derivative, was reported to have anticancer effect in albino rats with methylcholanthrene-induced fibrosarcoma, as well as increasing their survival time. The medicine also has a significant anti-inflammatory and pain-relieving effect. The effects of tumour treatment on DNA, RNA, and protein levels in various organs were also investigated. [118]

**Chemotherapeutic activity**
Identifying the active chemical constituents of ancient medications, as well as their molecular targets, is an appealing therapeutic goal. Embelin, a substance derived predominantly from the *Embelia ribes* plant, has been found to have chemopreventive, anti-inflammatory, and apoptotic properties via an unknown mechanism. Because nuclear factor kappaB (NF-kappaB) regulates multiple genes linked to apoptosis, researchers hypothesised that embelin’s activity could be mediated via NF-kappaB activation [119].

**Contraceptive activity**
Plants were identified and collected around India in the hunt for historically medicinal plants with contraceptive potency, most of which were purchased from Ayurvedic remedy sellers. Different organic solvents were used to air dry, cut, and process the plants. Rats, mice, and hamsters were used to test the herbs’ contraceptive qualities. Orally administered doses of 100-200 mg/kg of 137 plants were given to 5-6 animals per plant. 27 appeared promising enough to warrant additional investigation, with adult rats receiving 2-3 extracts from each plant. 14 plants were shown to have contraceptive properties. Artabotrya odoratissimus Linn and *Embelia ribes* Burm were discovered to exhibit fascinating biologic features but string hazardous consequences [120].

**Anti-obesity activity**
Ethanol extract of *E. ribes* reduced serum levels of leptin by 45 percent, insulin by 37 percent, glucose by 28 percent, total cholesterol by 18 percent, and triglycerides by 24 percent, while increasing HDL-C by 31 percent. Furthermore, in obese rats, extract of *Embelia ribes* reduced myocardial lipid peroxidation and enhanced antioxidant levels [121].

**Hepatoprotective activity**
In mice, an extract of *E. ribes* showed hepatoprotective action. Paracetamol was found to cause hepatocellular damage. The amount of SGPT in mice treated with extract is reduced in a dose-dependent manner [122].

**Conclusion**
The medicinal scrambling shrub climber *Embelia ribes* Burm f. belongs to the Myrsinaceae family. Phytochemical screening of *Embelia ribes* Burm f. were used as standardising parameters in the current study. Identification of plants has become a key challenge in Ayurveda, Siddha, and other Indian traditional systems of medicine, as our source of information. The traditional use and research work on biological activity of *Embelia ribes* suggest that it could be used in treatment of several diseases such as Anthelmintic, Anti-bacterial, Antioxidant property, Anti-diabetic, Anticonvulsant, Anti-cancer, Antihyperlipidemic, Ascaricidal properties, Antifungal, Wound healing, Antihyperhomocysteinemic, Molluscicidal, Antifertility, Antihyperglycemic, Antinematodal, Antiproliferative, Antispermatogenic, Antitumor and anti-inflammatory, Chemotherapeutic, Contraceptive, Anxiolytic, Antidepressant, Antimitotic, Cardio protective effect, Anti-obesity, Hepatoprotective, Analgesic activity and also more research work should be carried out on isolated constituent.
